

# Deployment of WPF Application

## Deployment of a WPF Application

Deploying a PDSA Framework WPF application is just like deploying any other WPF application.

## Create a Runtime License

Open up the PDSA Framework Utilities and run the “Runtime License Creator” utility. See the instructions for this utility for more information. Add the generated runtime license to the root of your WPF project. See Chapter 0 – Deployment Introduction for more information.

## Create a Setup Program

Use whatever setup application you wish to build installation media that you can distribute to your user. Or maybe use Click-Once to build a web installation package for your users to use. Be sure to include the PDSA Runtime license file in the final distribution of your application. This file belongs in the same installation location as your .EXE file.

Distribute your application as you normally would.

# Summary

In this chapter you learned the different settings you should modify when you are ready to move your .NET application to production.
